Generate Input Embeddings

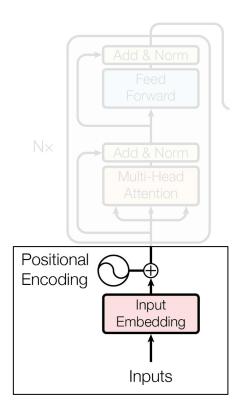

Requirements for Positional Encodings

- Some representation of time? (like seq2seq?)
- Should be unique for each position not cyclic

Requirements for Positional Encodings

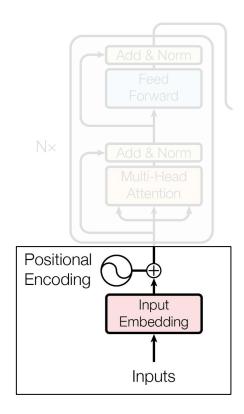

- Some representation of time? (like seq2seq?)
- Should be unique for each position not cyclic

Possible Candidates:

$$P_{t+1} = P_t + \Delta c$$

$$P_{t+1} = e^{P_{t_{\Delta}}c}$$

$$P_{t+1} = P_t^{\cdot t\Delta c}$$

Requirements for Positional Encodings

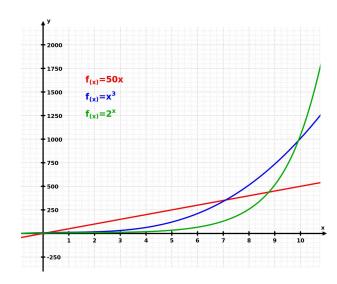

- Some representation of time? (like seq2seq?)
- Should be unique for each position not cyclic

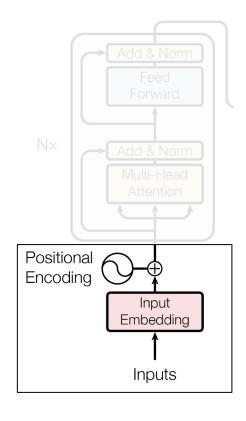

Possible Candidates:

$$P_{t+1} = P_t + \Delta c$$

$$P_{t+1} = e^{P_{t_{\Delta}}c}$$

$$P_{t+1} = P_t^{\cdot t\Delta c}$$

Requirements for Positional Encodings

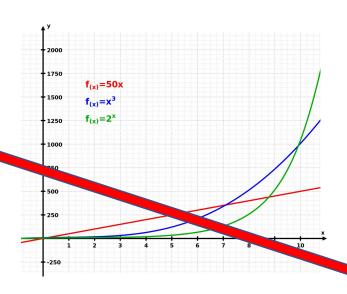

- Some representation of time? (like seq2seq?)
- Should be unique for each position not cyclic

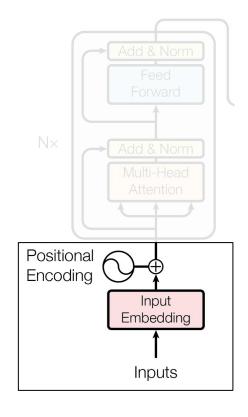

Possible Candidates:

$$P_{t+1} = P_t + \Delta c$$

$$P_{t+1} = P_t \wedge c$$

$$P_{t+1} = P_t^{\cdot t\Delta c}$$

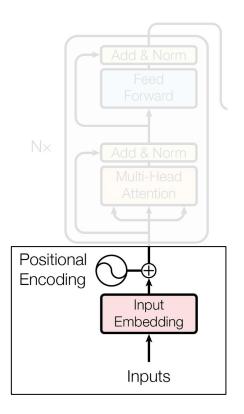

Requirements for Positional Encodings

- Some representation of time? (like seq2seq?)
- Should be unique for each position not cyclic
- Bounded

Possible Candidates:

$$P(t + t') = M^{t'} \times P(t)$$

Requirements for Positional Encodings

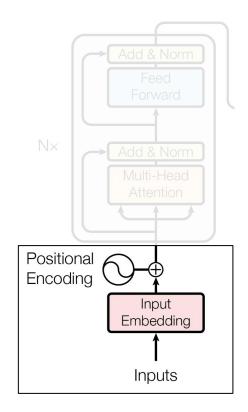

- Some representation of time? (like seq2seq?)
- Should be unique for each position not cyclic
- Bounded

Possible Candidates:

$$P(t + t') = M^{t'} \times P(t)$$

M?

- 1. Should be a unitary matrix
- 2. Magnitudes of eigen value should be 1 -> norm preserving

Requirements for Positional Encodings

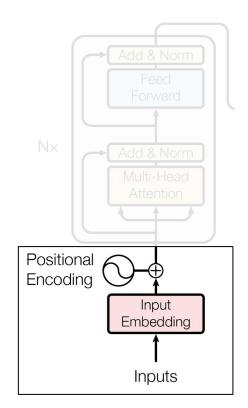

- Some representation of time? (like seq2seq?)
- Should be unique for each position not cyclic
- Bounded

Possible Candidates:

$$P(t + t') = M^{t'} \times P(t)$$

M

- The matrix can be learnt
- 2. Produces unique rotated embeddings each time

Rotary Position Embedding

ROFORMER: ENHANCED TRANSFORMER WITH ROTARY POSITION EMBEDDING

$$f_{\{q,k\}}(\boldsymbol{x}_m,m) = \begin{pmatrix} \cos m\theta & -\sin m\theta \\ \sin m\theta & \cos m\theta \end{pmatrix} \begin{pmatrix} W_{\{q,k\}}^{(11)} & W_{\{q,k\}}^{(12)} \\ W_{\{q,k\}}^{(21)} & W_{\{q,k\}}^{(22)} \end{pmatrix} \begin{pmatrix} x_m^{(1)} \\ x_m^{(2)} \end{pmatrix}$$

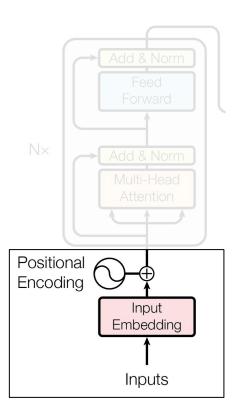

Table 2: Comparing RoFormer and BERT by fine tuning on downstream GLEU tasks.

Model	MRPC	SST-2	QNLI	STS-B	QQP	MNLI(m/mm)
BERTDevlin et al. [2019]	88.9	93.5	90.5	85.8	71.2	84.6/83.4
RoFormer	89.5	90.7	88.0	87.0	86.4	80.2/79.8

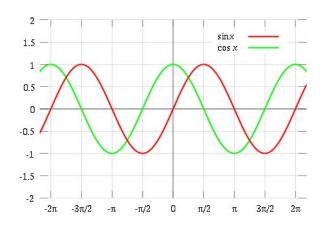

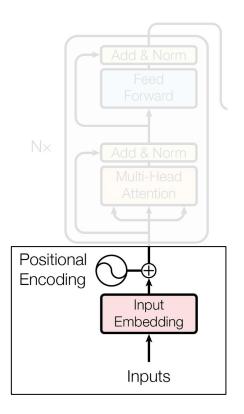

Requirements for Position Encodings

- Some representation of time ? (like seq2seq ?)
- Should be unique for each position not cyclic
- Bounded

Actual Candidates:

sine(**g(t)**)
cosine(**g(t)**)

Requirements for g(t)

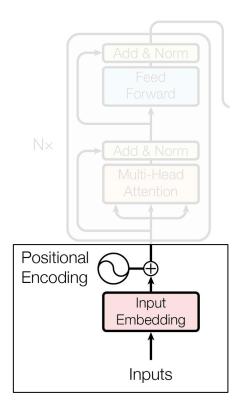

- Must have same dimensions as input embeddings
- Must produce overall unique encodings

pos -> idx of the token in input sentence

-> ith dimension out of d

$$PE_{(pos,2i)} = sin(pos/10000^{2i/d_{model}}) \ PE_{(pos,2i+1)} = cos(pos/10000^{2i/d_{model}})$$

$$PE_{(pos,2i+1)} = cos(pos/10000^{2i/d_{model}})$$

$$PE_{(pos,2i)} = sin(pos/10000^{2i/d_{model}}) \ PE_{(pos,2i+1)} = cos(pos/10000^{2i/d_{model}})$$

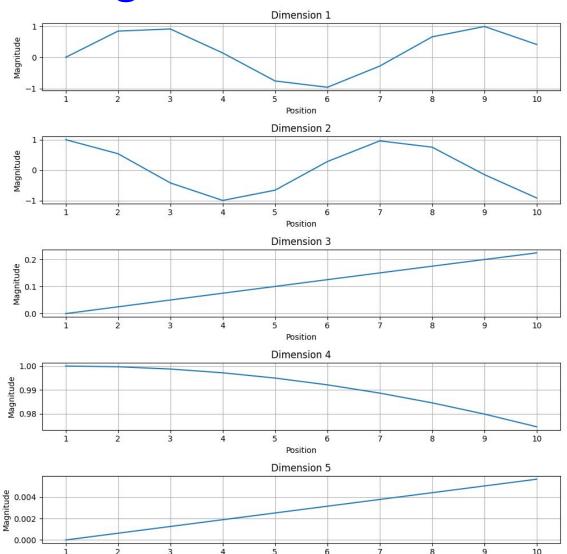

Requirements for g(t)

- Must have same dimensions as input embeddings
- Must produce overall unique encodings

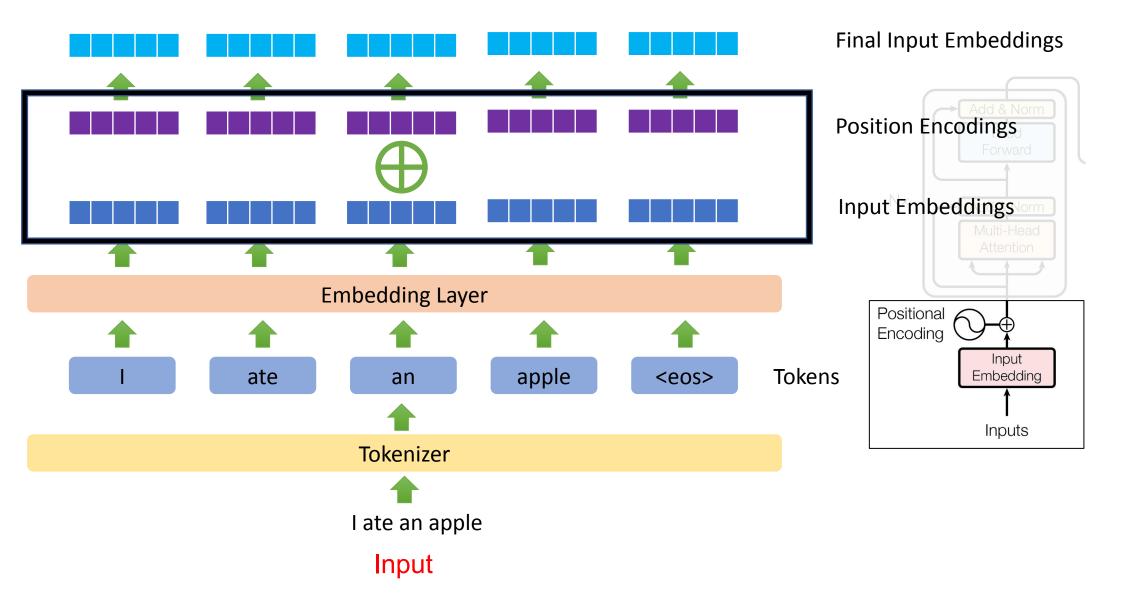

pos -> idx of the token in input sentence

i -> ith dimension out of d

Part 2

Pre-training and Fine-tuning

How to train and fine-tune transformers

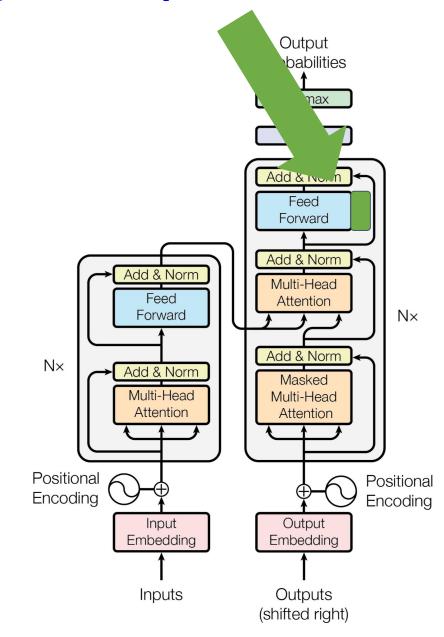

Lot's of data, learn general things. May serve as a parameter initialization.

Usually requires significant computational resources and time.

Adaptation to the specific task.

Potentially less computationally intensive.

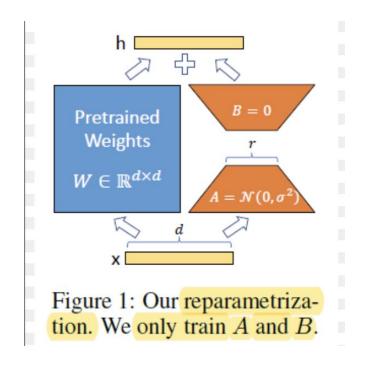

Parameter-Efficient Fine-Tuning Techniques

BitFit: https://arxiv.org/abs/2106.10199

Part 3

Transformer Applications

Data Modalities

- Language (see Part 4 of the lecture)
- Vision
- Audio
- ... and many other modalities (e.g., biological/physiological signals, etc.)
- Multimodal (>2 data modalities)

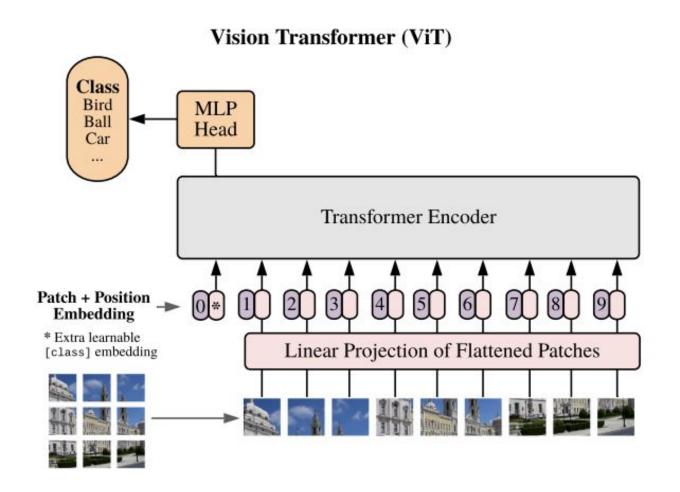

Computer Vision

- 1. In computer vision convolutional architectures remain largely dominant.
- 2. Inspired by NLP successes, multiple works try introducing combining CNN-like architectures with self-attention or replacing the convolutions entirely.
- 3. However, they faced challenges with performance and scaling.
- 4. Key breakthrough Vision Transformer (ViT) released in 2020

Computer Vision - Tokenization

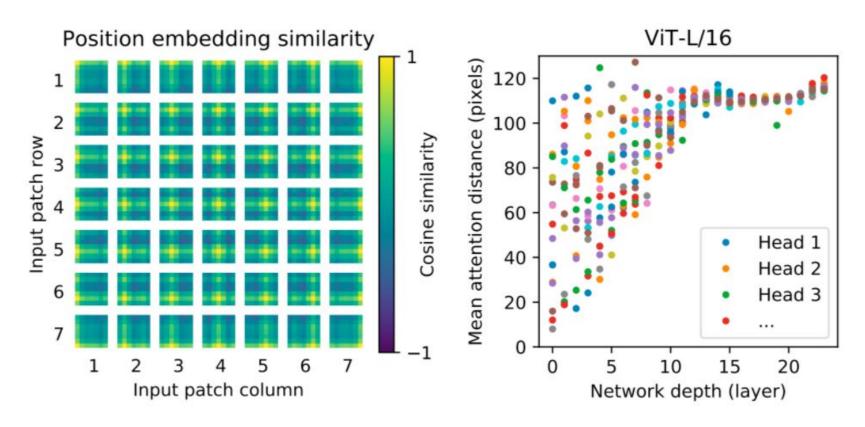

Vision Transformer (ViT) Model Architecture

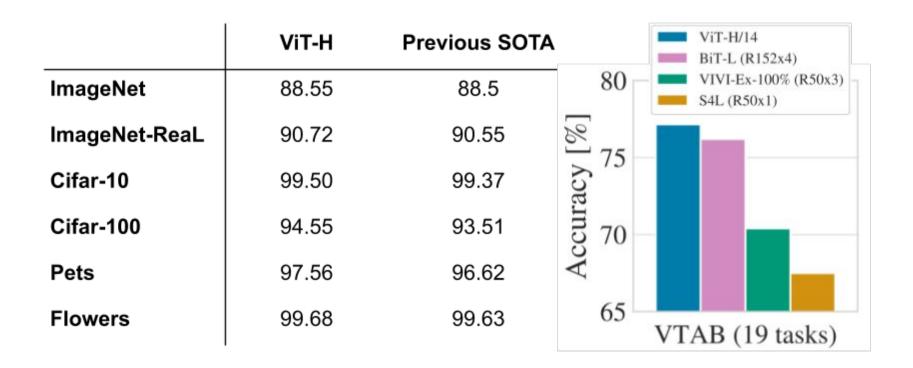

- 1. Split an image into fixed-size patches (16x16 pixels).
- 2. Tokenize each path (linear projection of flattened patches).
- 3. Add position embedding.
- 4. Feed the resulting sequence of vectors to a standard Transformer encoder.
- 5. For classification, add an extra learnable "classification token" to the sequence.

ViT - Learning Patterns

- ViT learns the grid like structure of the image patches via its position embeddings.
- The lower layers contain both global and local features, the higher layers contain only global features.

ViT Performance

ViT model attains state-of-the-art performance on multiple popular benchmarks, including 88.55% top-1 accuracy on ImageNet and 99.50% on CIFAR-10

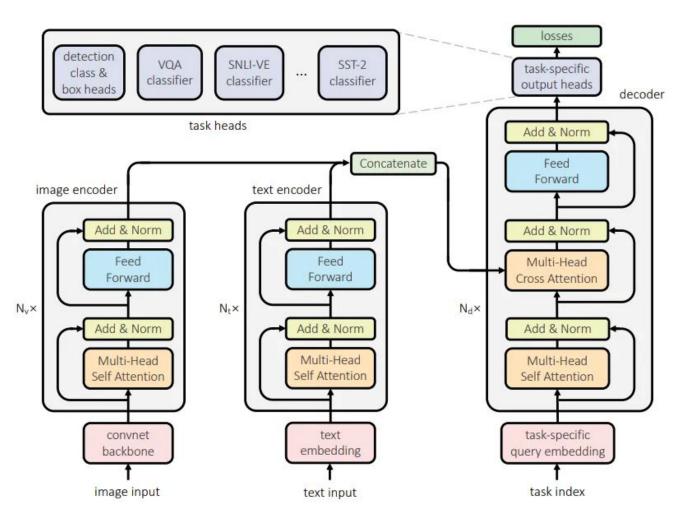

Audio

Similar to the computer vision but with spectrograms instead of images.

Exists as encoder-decoder variants or as an encoder-only variant with CTC loss.

Could be augmented with the CNN.

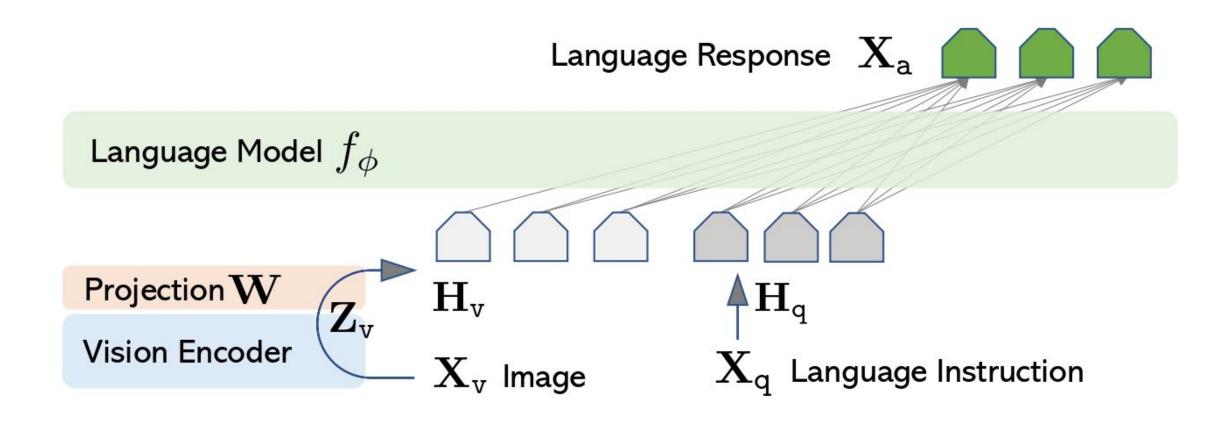

Multimodal Transformer - UniT

- UniT handles 7 tasks ranging from object detection to vision-and language reasoning and natural language understanding.
- 2. Components:
 - An image encoder to encode the visual inputs.
 - A text encoder to encode the language inputs.
 - A joint decoder with per-task query embedding.
 - Task-specific heads to make the final outputs for each task.

UniT: Multimodal Multitask Learning with a Unified Transformer

Multimodal Transformer - LLaVA

Multimodal Transformer - LLaVA

Start a new conversation, and the history is cleared.

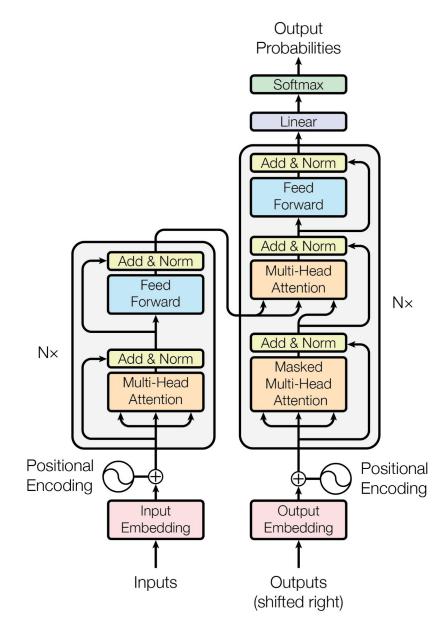

Do you know who drew this painting?

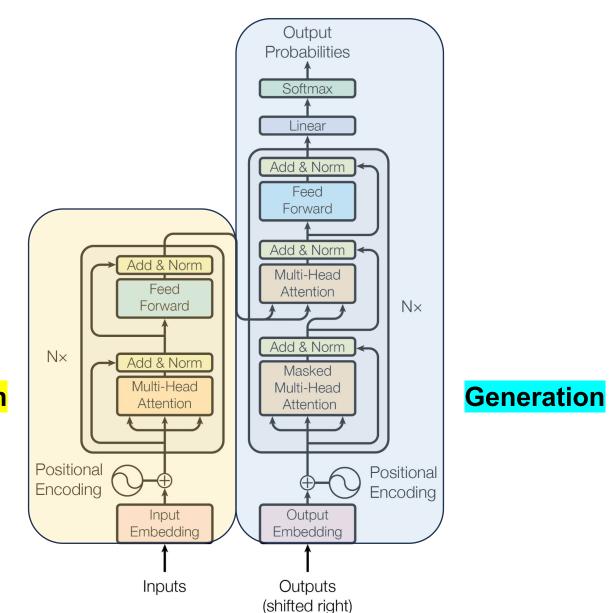

The painting depicts a dog in a humorous situation, where it appears to be wearing a woman's dress and standing in front of a landscape. Although the artist of the painting is not explicitly identified, it could be a reference to the famous artist Da Vinci, known for his artistic works, including the Mona Lisa. The painting is likely a creative and comical take on the traditional portrait style, replacing a human figure with a dog dressed in a woman's clothing, making it an interesting and amusing visual piece.

Table 2: SQuAD results. The BERT ensemble is 7x systems which use different pre-training checkpoints and fine-tuning seeds.

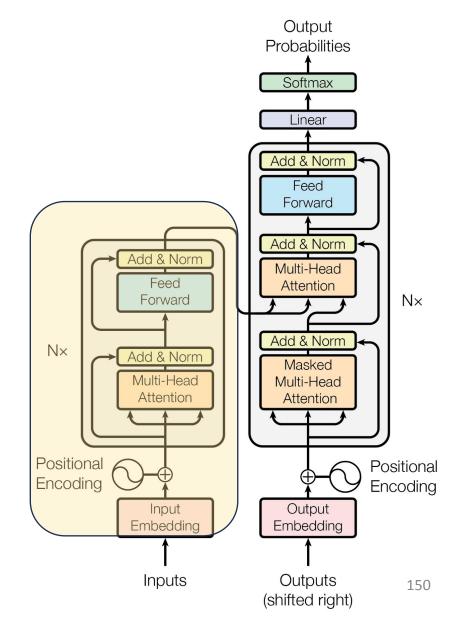

What is our takeaway from BERT?

- Pre-training tasks can be invented flexibly...
 - Effective representations can be derived from a flexible regime of pre-training tasks.

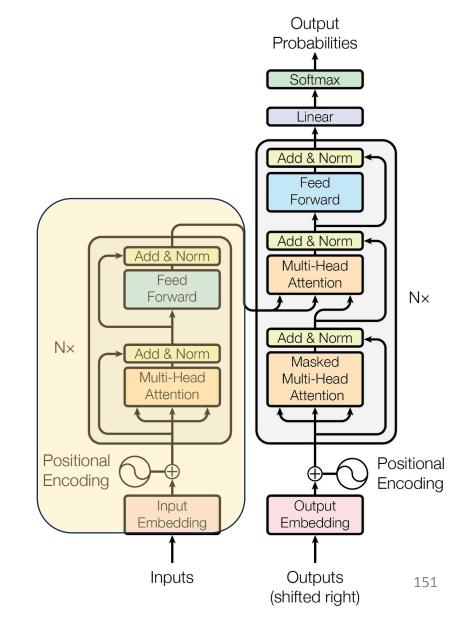

What is our takeaway from BERT?

- Pre-training tasks can be invented flexibly...
 - Effective representations can be derived from a flexible regime of pre-training tasks.
- Different NLP tasks seem to be highly transferable with each other...
 - As long as we have effective representations, that seems to form a general model which can serve as the backbone for many specialized models.

What is our takeaway from BERT?

- Pre-training tasks can be invented flexibly...

BERT Oct 2018

Representation

- Similarly motivated as BERT, though differently designed
 - Can we leverage large amounts of unlabeled data to pretrain an LM that understands general patterns?

GPT Pre-Training Corpus:

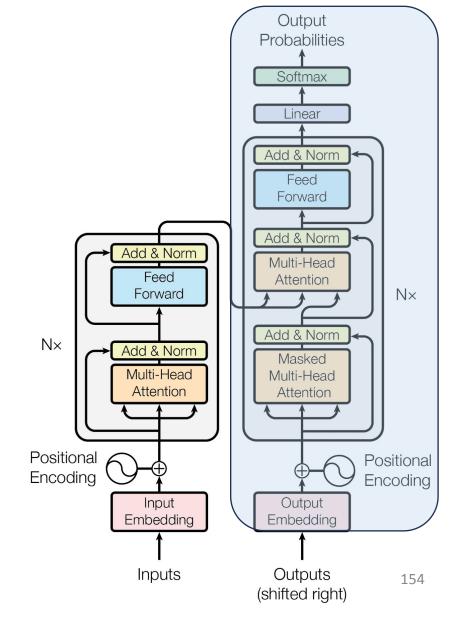

Similarly, BooksCorpus and English Wikipedia

GPT Pre-Training Tasks:

- Predict the next token, given the previous tokens
 - More learning signals than MLM

GPT Pre-Training Results:

- GPT 117M Params
 - Similarly competitive on GLUE and SQuAD

GPT Fine-Tuning:

 Prompt-format task-specific text as a continuous stream for the model to fit

Summarization

Summarize this article:

The summary is:

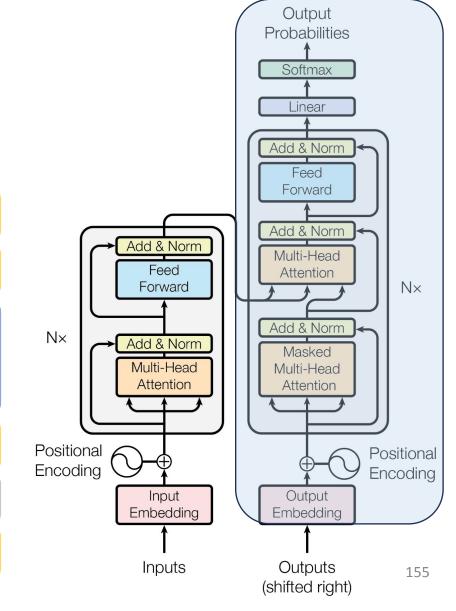

Answer the question based on the context.

QA

Context:

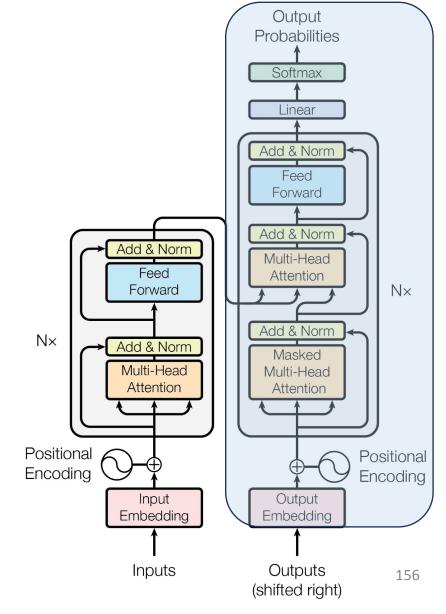

Question:

Answer:

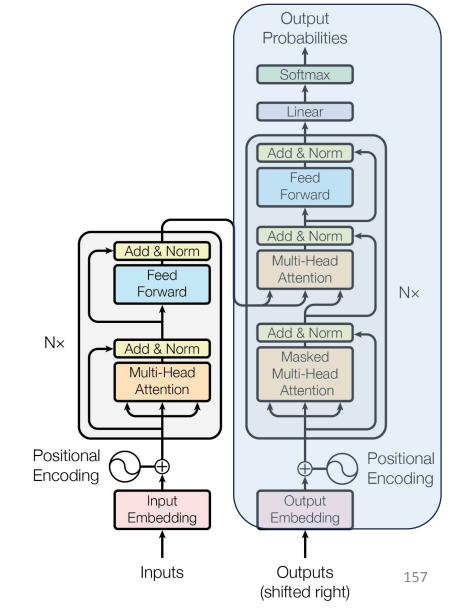

What is our takeaway from GPT?

- The Effectiveness of Self-Supervised Learning
 - Specifically, the model seems to be able to learn from generating the language itself, rather than from any specific task we might cook up.

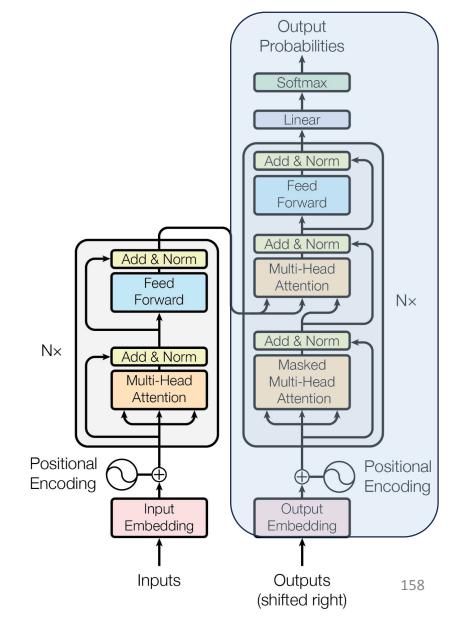

What is our takeaway from GPT?

- The Effectiveness of Self-Supervised Learning
 - Specifically, the model seems to be able to learn from generating the language *itself*, rather than from any specific task we might cook up.
- Language Model as a Knowledge Base
 - Specifically, a generatively pretrained model seems to have a decent zero-shot performance on a range of NLP tasks.

What is our takeaway from GPT?

- The Effectiveness of Self-Supervised Learning
 - Specifically, the model seems to be able to learn from generating the language *itself*, rather than from any specific task we might cook up.
- Language Model as a Knowledge Base
 - Specifically, a generatively pretrained model seems to have a decent zero-shot performance on a range of NLP tasks.
- And scaling works!!!

Poll 3 - @1579

The original GPT's parameter count is closest to...

- A. 117
- B. 117K
- C. 117M
- D. 117B

Poll 3 - @1579

The original GPT's parameter count is closest to...

- A. 117
- B. 117K
- C. 117M
- D. 117B

Generation

From both BERT and GPT, we learn that...

• Transformers seem to provide a new class of generalist models that are capable of capturing knowledge which is more fundamental than task-specific abilities.

Before LLMs

- Feature Engineering
 - How do we design or select the best features for a task?

From both BERT and GPT, we learn that...

• Transformers seem to provide a new class of generalist models that are capable of capturing knowledge which is more fundamental than task-specific abilities.

Before LLMs

- Feature Engineering
 - How do we design or select the best features for a task?
- Model Selection
 - Which model is best for which type of task?

From both BERT and GPT, we learn that...

• Transformers seem to provide a new class of generalist models that are capable of capturing knowledge which is more fundamental than task-specific abilities.

Before LLMs

- Feature Engineering
 - How do we design or select the best features for a task?
- Model Selection
 - Which model is best for which type of task?
- Transfer Learning
 - Given scarce labeled data, how do we transfer knowledge from other domains?

From both BERT and GPT, we learn that...

• Transformers seem to provide a new class of generalist models that are capable of capturing knowledge which is more fundamental than task-specific abilities.

Before LLMs

Since LLMs

Feature Engineering

- How do we design or select the best features for a task?
- Model Selection
 - Which model is best for which type of task?
- Transfer Learning
 - Given scarce labeled data, how do we transfer knowledge from other domains?
- Overfitting vs Generalization
 - How do we balance complexity and capacity to prevent overfitting while maintaining good performance?

From both BERT and GPT, we learn that...

Since LLMs

Pre-training and Fine-tuning

 How do we leverage large scales of unlabeled data out there previously under-leveraged?

Zero-shot and Few-shot learning

 How can we make models perform on tasks they are <u>not</u> trained on?

Prompting

 How do we make models understand their task simply by describing it in natural language?

Interpretability and Explainability

 How can we <u>understand</u> the inner workings of our own models?

What has caused this paradigm shift?

- What has caused this paradigm shift?
 - Recall: Problem in recurrent networks
 - Information is effectively lost during encoding of long sequences
 - Sequential nature disables parallel training and favors late timestep inputs

- What has caused this paradigm shift?
 - Recall: Problem in recurrent networks
 - Information is effectively lost during encoding of long sequences
 - Sequential nature disables parallel training and favors late timestep inputs
 - Solution: Attention is all you need!!!
 - Handling long-range dependencies
 - Parallel training
 - Dynamic attention weights based on inputs

Attention and Transformer – is this the end?

- Attention and Transformer is this the end?
 - Problem in current Transformer-based LLMs??

- Attention and Transformer is this the end?
 - Problem in current Transformer-based LLMs??
 - True understanding the material vs. memorization and pattern-matching
 - Cannot reliably follow rules factual hallucination e.g. inability in arithmetic

- Attention and Transformer is this the end?
 - Problem in current Transformer-based LLMs??
 - True understanding the material vs. memorization and pattern-matching
 - Cannot reliably follow rules factual hallucination e.g. inability in arithmetic

• Solution: ???

Looking Back

It is true that language models are just programmed to predict the next token...

In fact, all animals, including us, are just programmed to survive and reproduce, and yet amazingly complex and beautiful stuff comes from it.

- Sam Altman*
